Continuation of 5. does NOT place the application in condition for allowance because: Applicant argued that prior art did not disclose initiating a server object in the same server process as a control module. As to applicant's arguments Hara disclosed the power controller controls the power unit controls the power unit to immediately turn on the power. On the other hand, for the power-off request, the power controller temporarily sends the power -off request to the agent through the SVP driver. The agent issues a system shutdown request to the network, and after the system is shutdown, sends the power off request to the power controller of the SVP board through the SVP (col. 6, lines 24-43). One ordinary skill in the art at the time of the invention can interpret the power controller as control module that controls the initiation of the server object or the computer system.
